- **0.25% Accuracy – 0.1%, 0.05% Accuracy Optional**

The Validyne Model P55 is a compact differential pressure transducer designed for industrial measurement applications. The variable reluctance sensing technology allows the P55 to be used in a wide variety of low pressure measurements where fast dynamic response, high resistance to vibration and superior signal stability through ambient temperature change is required. The P55 will accept both gases and liquids directly at the sensing diaphragm; there are no internal isolation fluids to slow the sensor response or cause excessive temperature shift errors.

The P55 is available in three output configurations: 4-20 mA current sink output, DC output and isolated DC output. The 4-20 mA output version is a true two-wire system which will operate over a supply voltage of 9 to 55 Vdc.

The DC version is a direct replacement for the Vdc signal. The isolated DC output version provides the same +/-5 Vdc signal, isolated from the power supply by 100 MOhms

The P55 is also available in an absolute pressure version with a welded variable reluctance sensor. Zero and span controls are available for external adjustment, and the wiring may be via connector or pigtail options.

Sensor wetted parts include 410 steel, suitable for inert gases and hydrocarbons, 316 SST for water-based fluids and Inconel or Hastelloy for corrosive applications. (See ordering information)

The P55 is Ideal for:

- **Level Measurements**
- **Hydraulic Systems**
- **Vehicle Testing**
- **Engine Test Cells**
- **Flight Test**
- **Liquid Chromatography**
